

A - Dice

分值: 100 分

Problem Statement

There are three dice, each with six faces.

Each die has 1, 2, 3, 4, 5, 6 written on its faces.

有三个骰子，每个都有六个面。

每个骰子的面上写着 1, 2, 3, 4, 5, 6。

When these dice are rolled simultaneously, is it possible for the sum of the rolled values to be X ?

同时掷这三个骰子时，朝上的点数之和有可能是 X 吗？

Constraints

- X is an integer between 1 and 20, inclusive.
 - X 是介于 1 和 20 之间的整数，包含边界值。
-

Input

The input is given from Standard Input in the following format:

输入按照以下格式从标准输入给出：

X

Output

If it is possible for the sum of the rolled values to be X , output Yes; otherwise, output No.

如果掷出的点数之和有可能为 X ，输出 Yes，否则输出 No。

Sample Input 1

15

Sample Output 1

Yes

For example, if the rolled values are 4, 5, 6, the sum is 15.

例如，若掷出的点数为 4, 5, 6，则和为 15。

Sample Input 2

2

Sample Output 2

No
